

Get Started

You can start irrigation using the sensor in two ways: automatically (Autostart) or manually by pressing the button on the sensor. Below, we'll guide you through both options - step by step.

If Autostart is Enabled (Recommended)

Begin by mounting the sensor on top of the irrigation pipe. Make sure both straps are securely fastened underneath the pipe.

You'll see this symbol in the app/portal:

The sensor will automatically detect when irrigation starts. This may take up to 10 minutes.

1. Set an endpoint (optional)

Stand next to the reel and tap Set endpoint in the portal. The map will open.

Tap Get location at the bottom of the map – or simply tap on the map where the reel is located.

2. Monitor from your phone

While irrigating, you can easily follow the progress in the portal. You'll see speed, estimated arrival time, and more.

Even if you're not actively monitoring, you'll still receive push notifications if something goes wrong.

3. Irrigation complete

When the reel reaches the endpoint and the water flow stops, the system will recognize that irrigation is finished. The event will then be saved in the Irrigation log.
